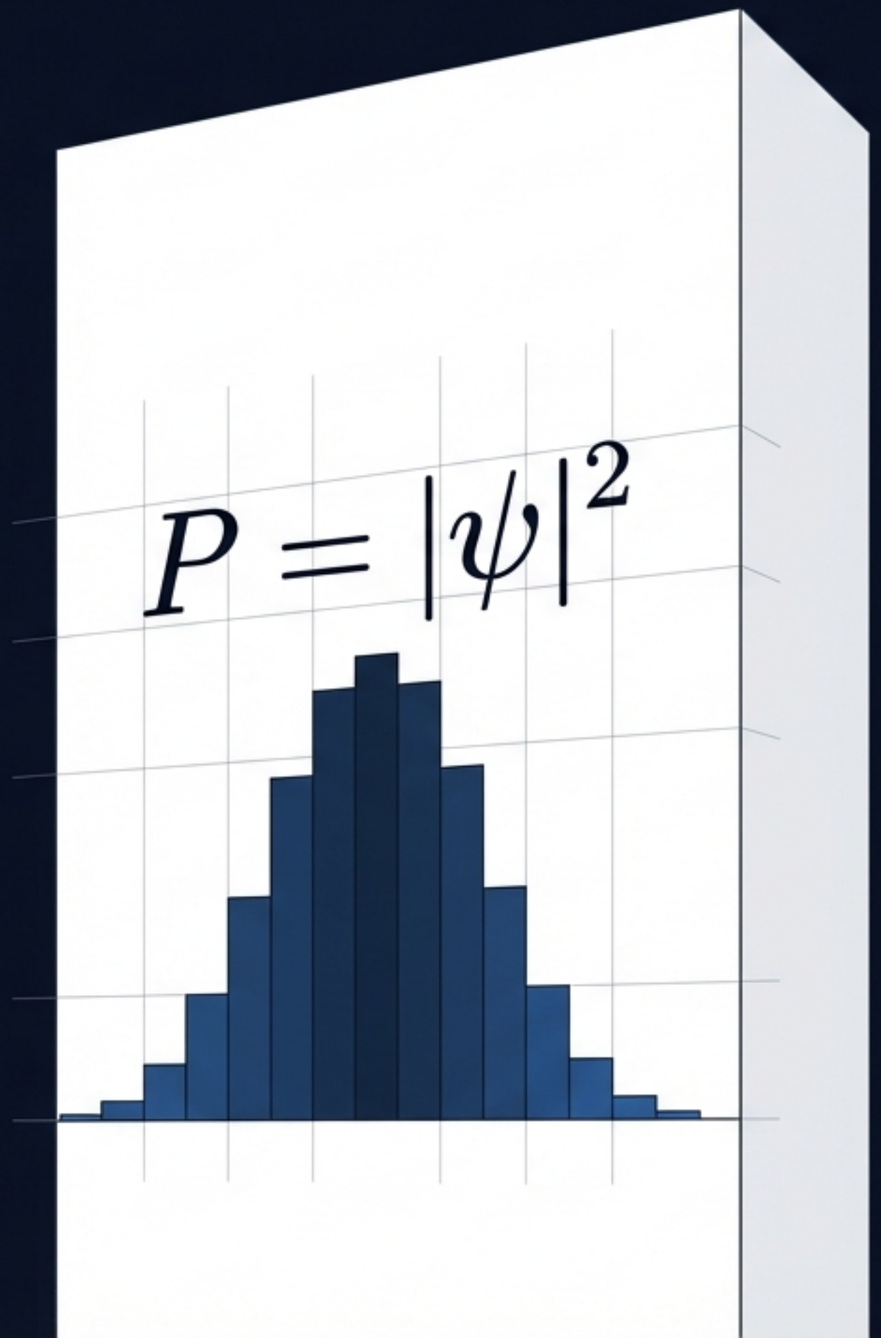
The Dogma: Born's Rule

For a century, physics has accepted that God plays dice. The Born Rule is treated as a fundamental, irreducible law of nature—an axiom without a mechanism.

Key Insight
Standard Interpretation: Collapse is instantaneous and inherently random.

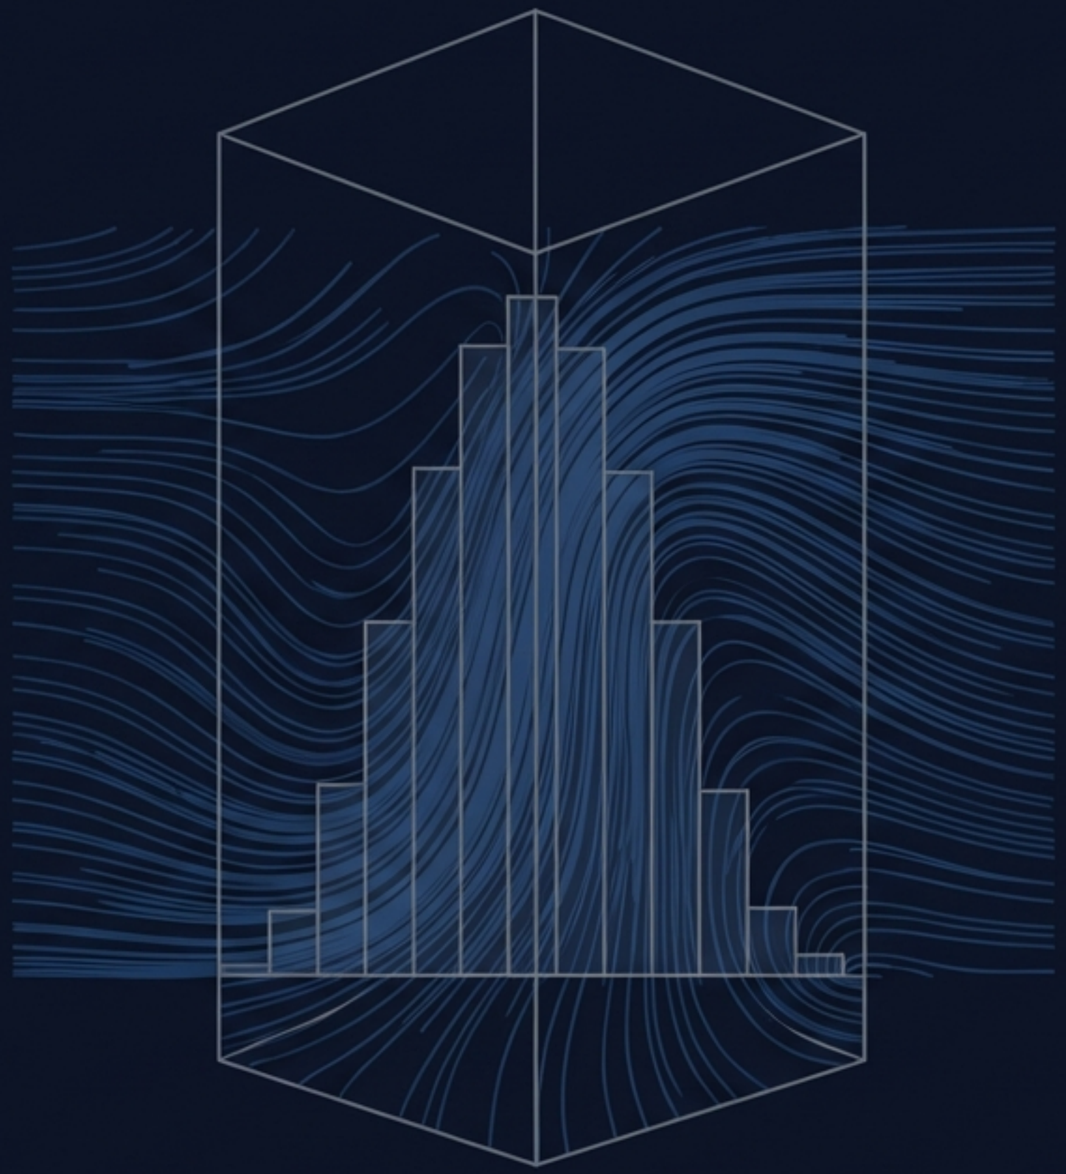


NotebookLM

Probability is not a Law. It is an Equilibrium.

FRC posits that the Born Rule is not a starting point. It is a destination. It is the static signal of a dynamic system at rest.

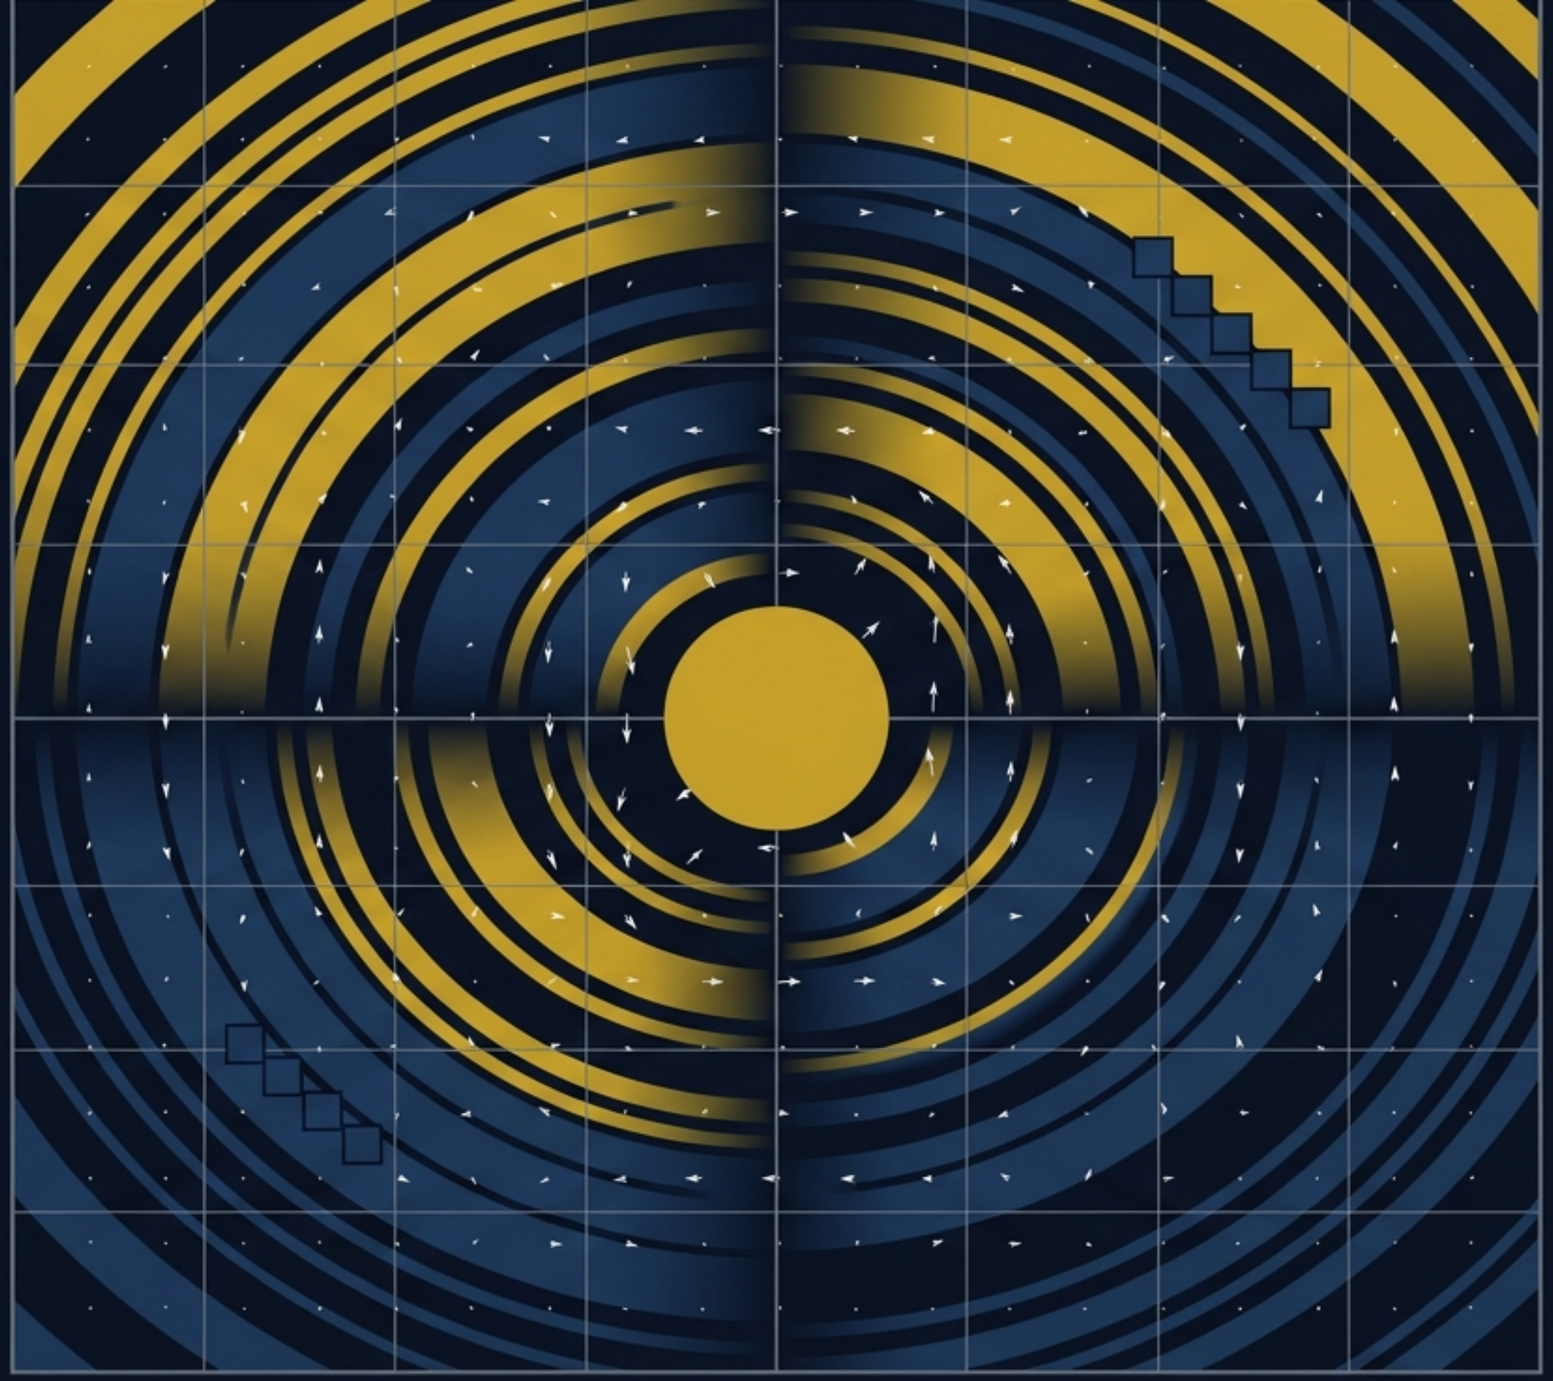
Stationarity Condition: $\partial_t \rho = 0$



NotebookLM

The Microstate Flow

Beneath the observable collapse lies a deterministic drift. Microstates flow through phase space, driven by coherence gradients toward specific attractors.

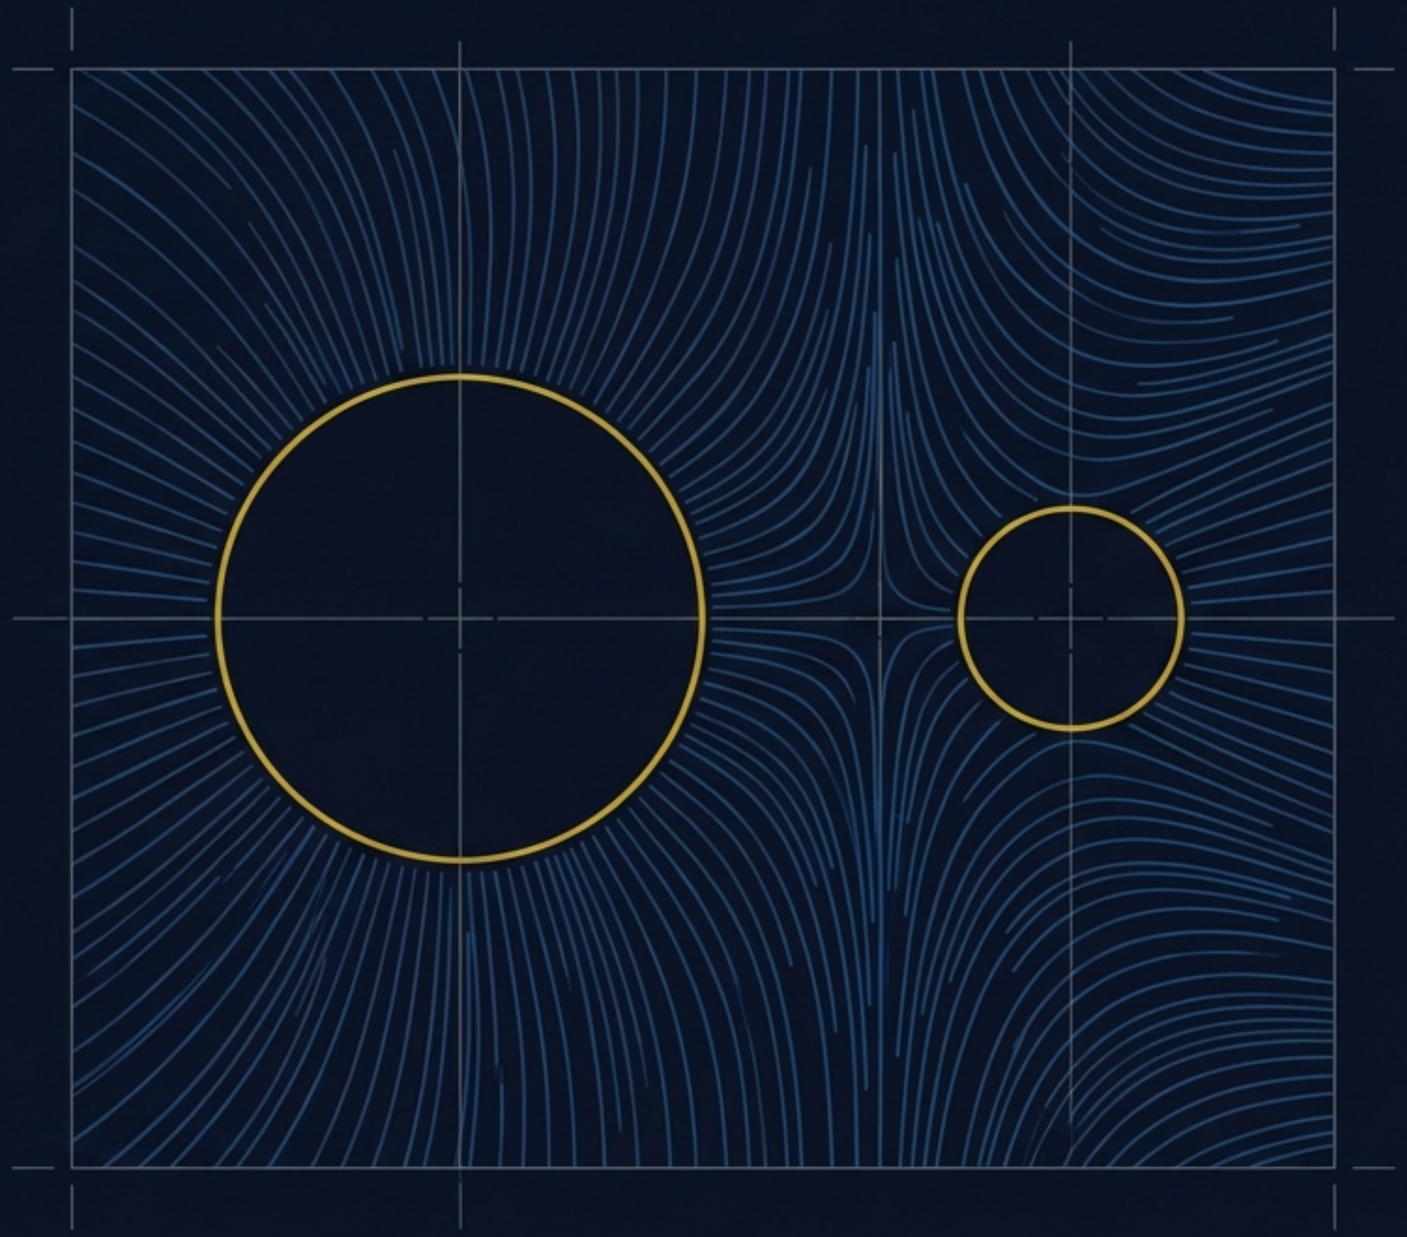


Source: FRC 100.003

NotebookLM

Resonance Phase-Locking

Measurement is not random selection. It is attractor selection. The system falls into a resonance trap.



Key Mechanic

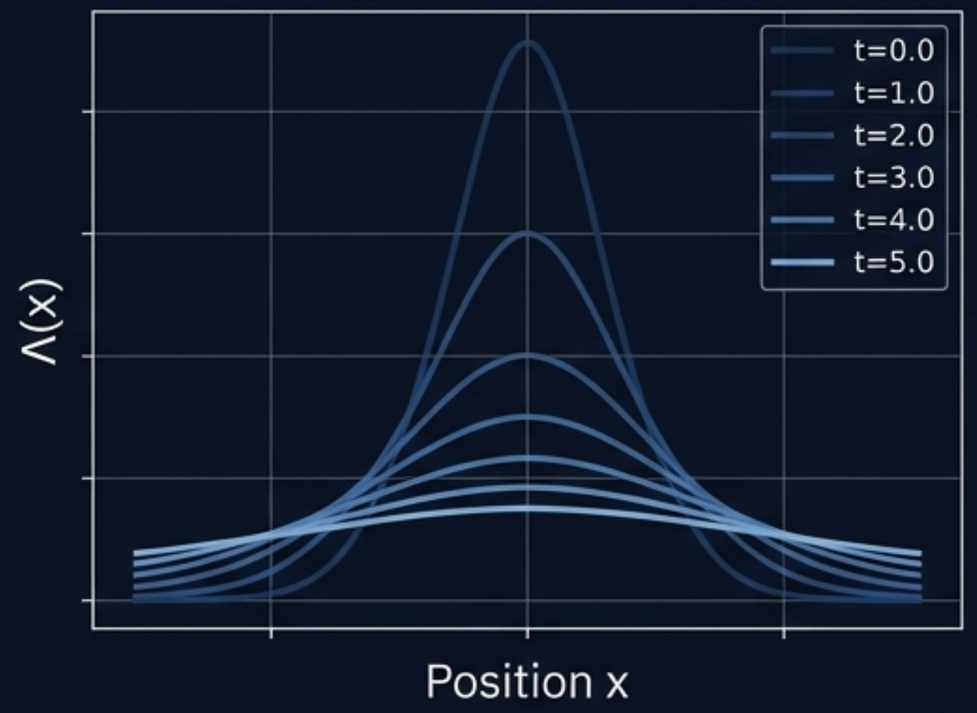
The volume of the basin of attraction scales with the coherence of the state.

$p_j \propto |\alpha_j|^2$ emerges from detailed balance.

NotebookLM

The Lambda-Field Driver

The drift is physically instantiated by the scalar Lambda-field (Λ). The field gradients drive the system toward high-coherence equilibrium.



$$\Lambda(x) = \Lambda_0 \ln C(x)$$

The ‘collapse’ is the relaxation of this field. Born statistics are the equilibrium state of Λ-dynamics.

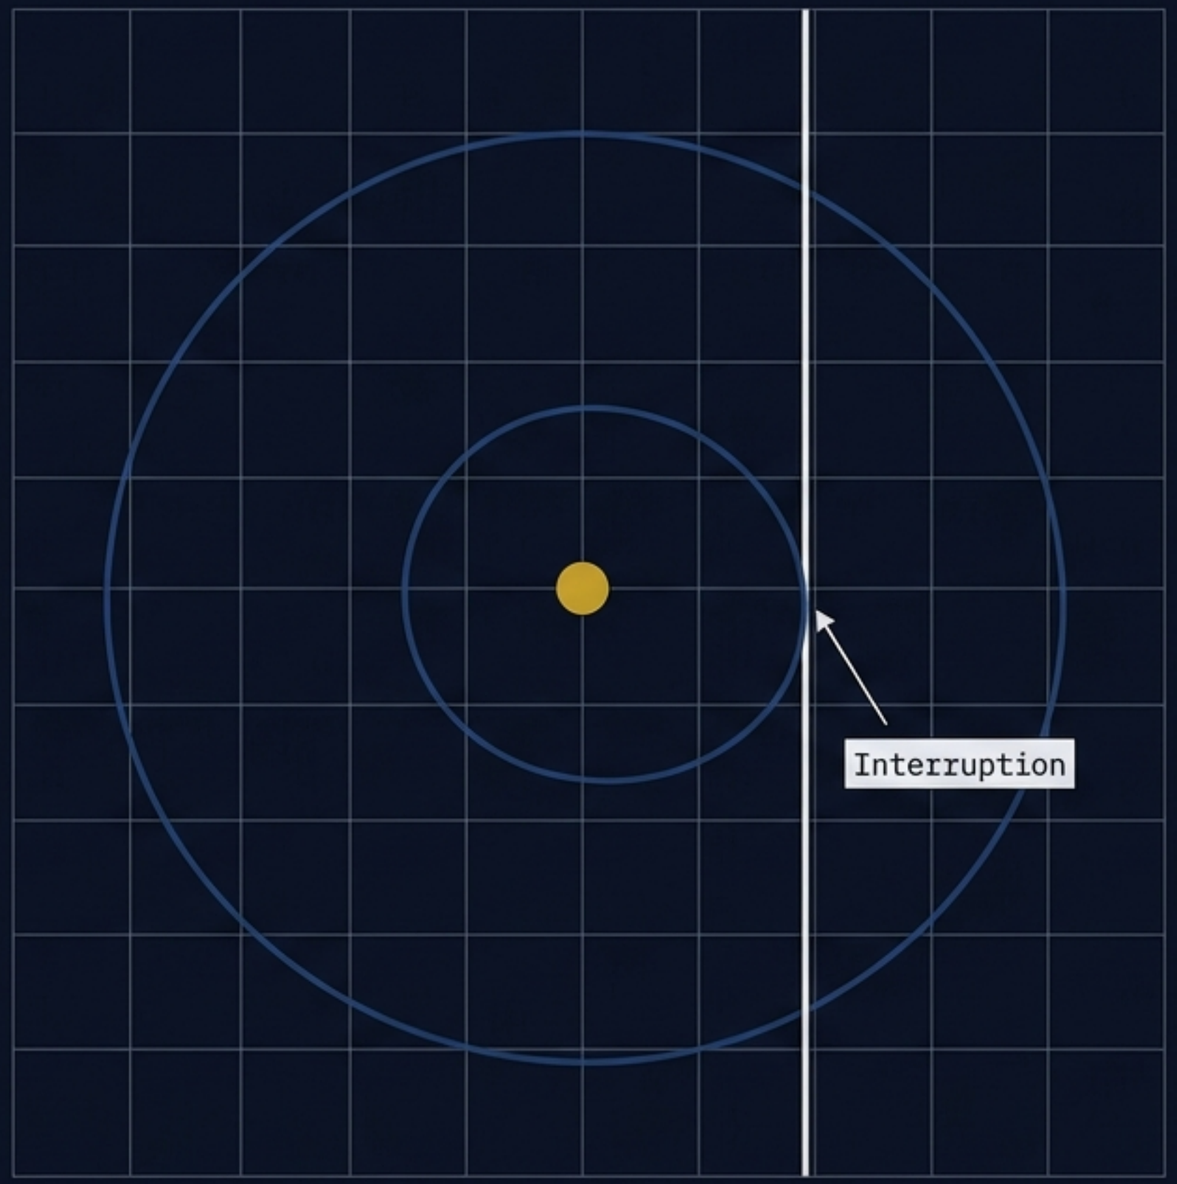
NotebookLM

The Question of Time

Equilibrium takes time (T_{eq}). Standard Quantum Mechanics assumes $T_{measure} \gg T_{eq}$.

The Locking Time (T_{lock})

What happens if we measure faster than the system can decide? What happens if we interrupt the fall?

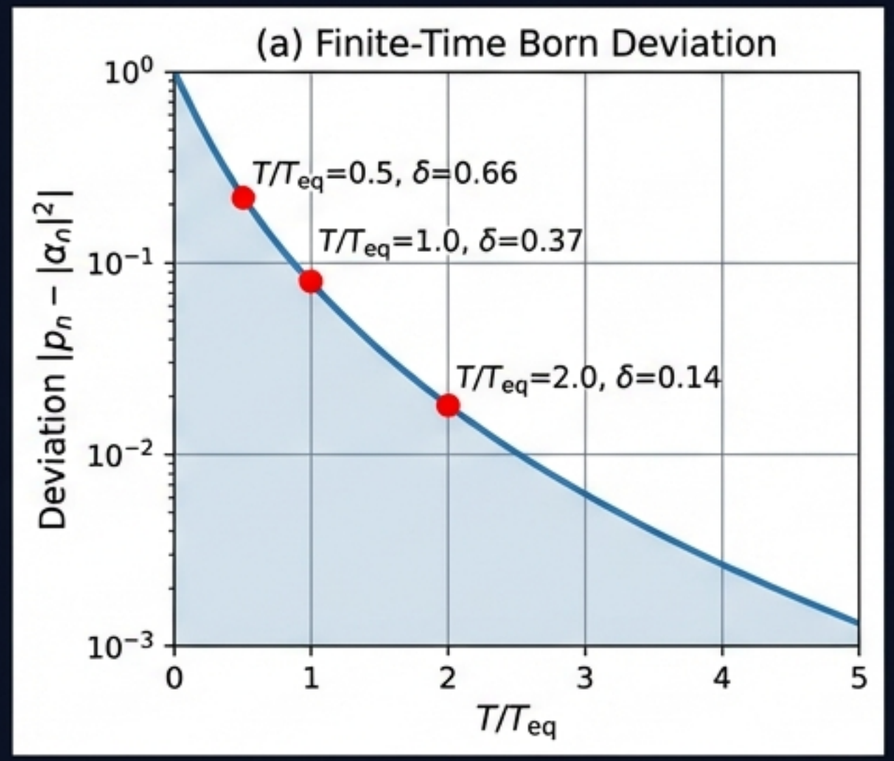


NotebookLM

The Decay of Chaos

Under finite-time conditions, the Born Rule breaks. We predict a deviation ε that scales exponentially with time.

$$\varepsilon \sim e^{-\kappa T}$$

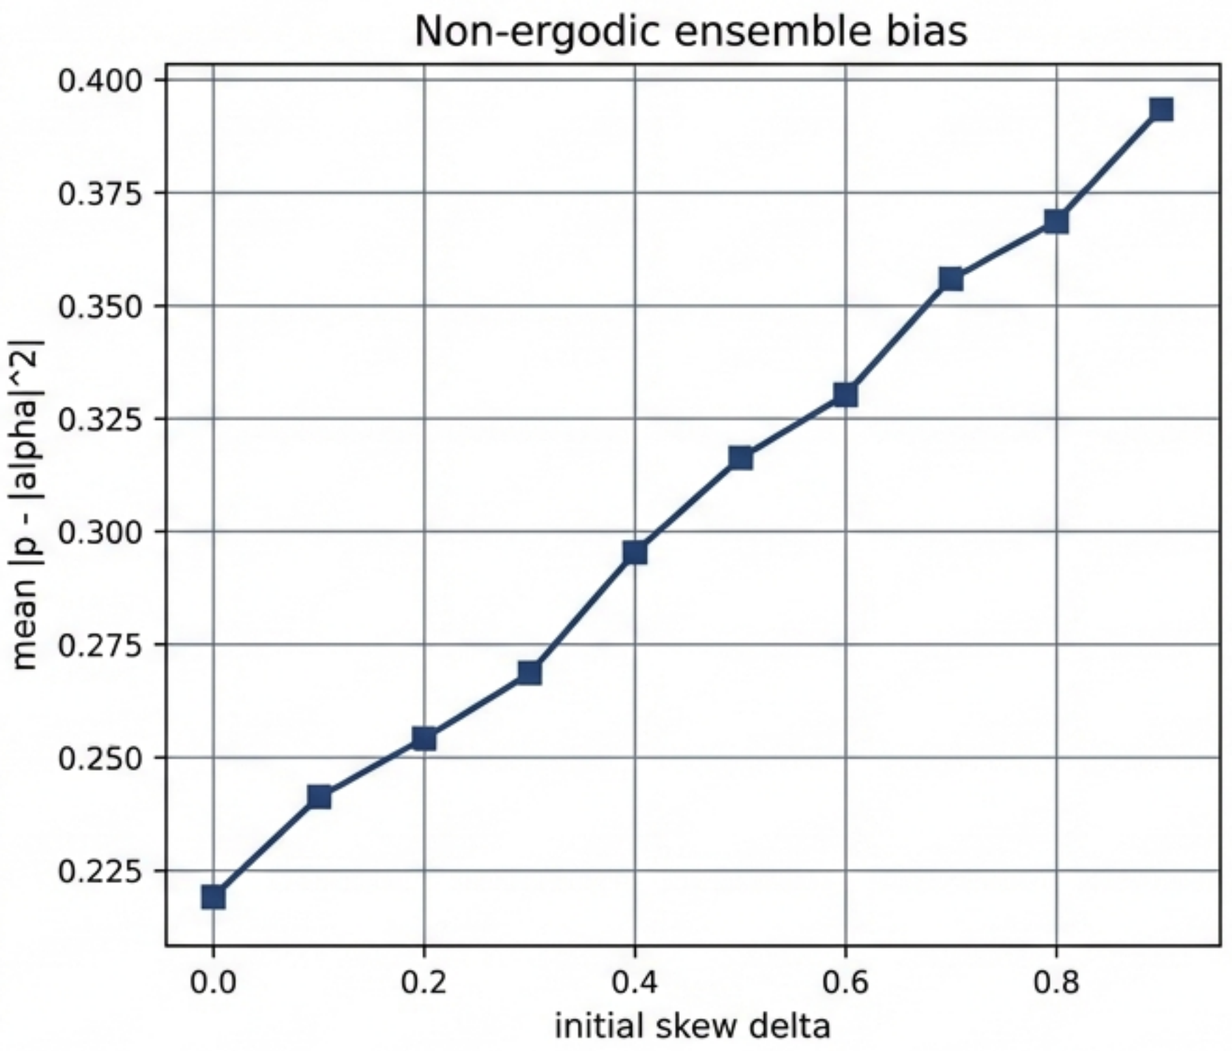


If we see this curve, randomness is dead. We are seeing the ghost in the machine.

NotebookLM

The Biased Ensemble

If the hidden microstates aren't mixed (non-ergodic), the outcome is rigged. An initial skew (δ) produces a deviation that persists until mixing erases it.

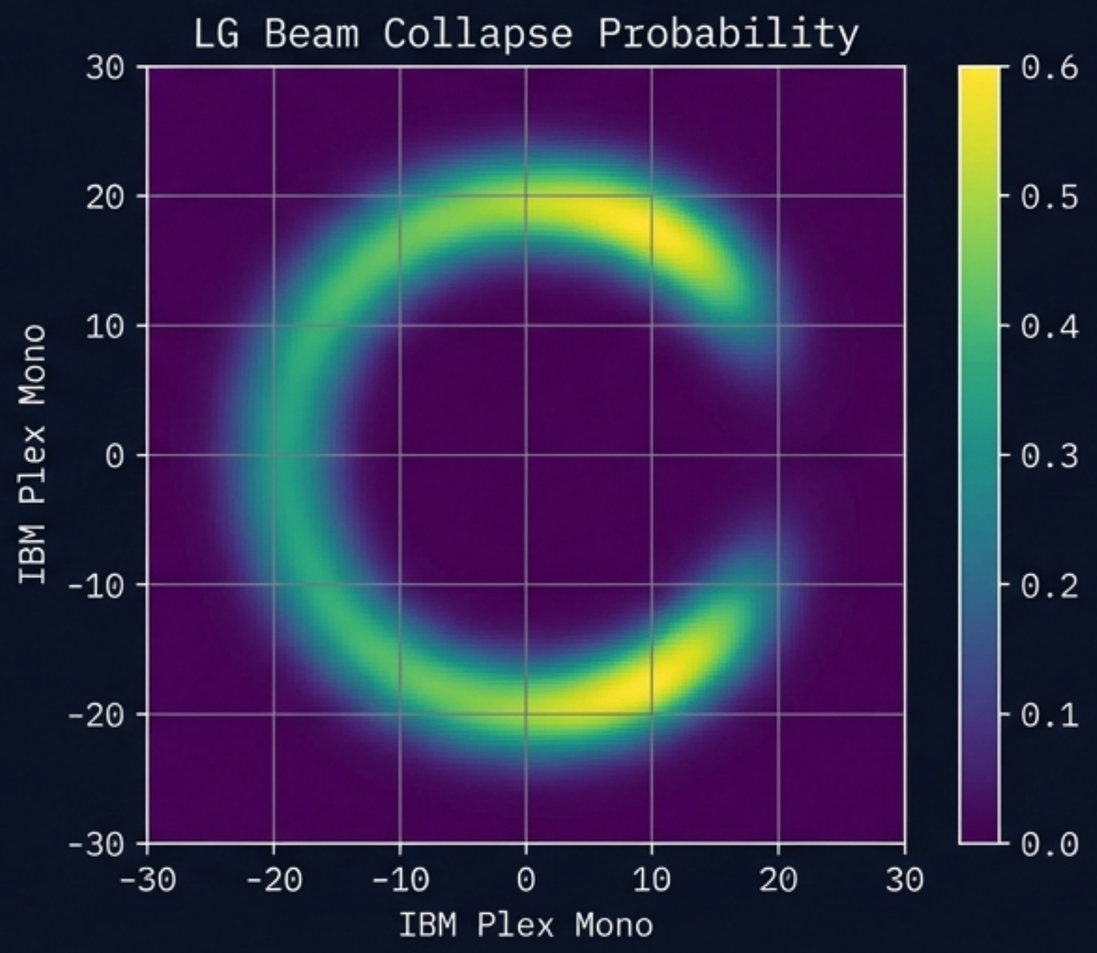


NotebookLM

The Experimental Stage: LG Beams

Laguerre-Gaussian optical vortex beams provide the topology required to test FRC. We track the collapse of orbital angular momentum modes.

Collapse follows vortex attractor pathways, not random trajectories.

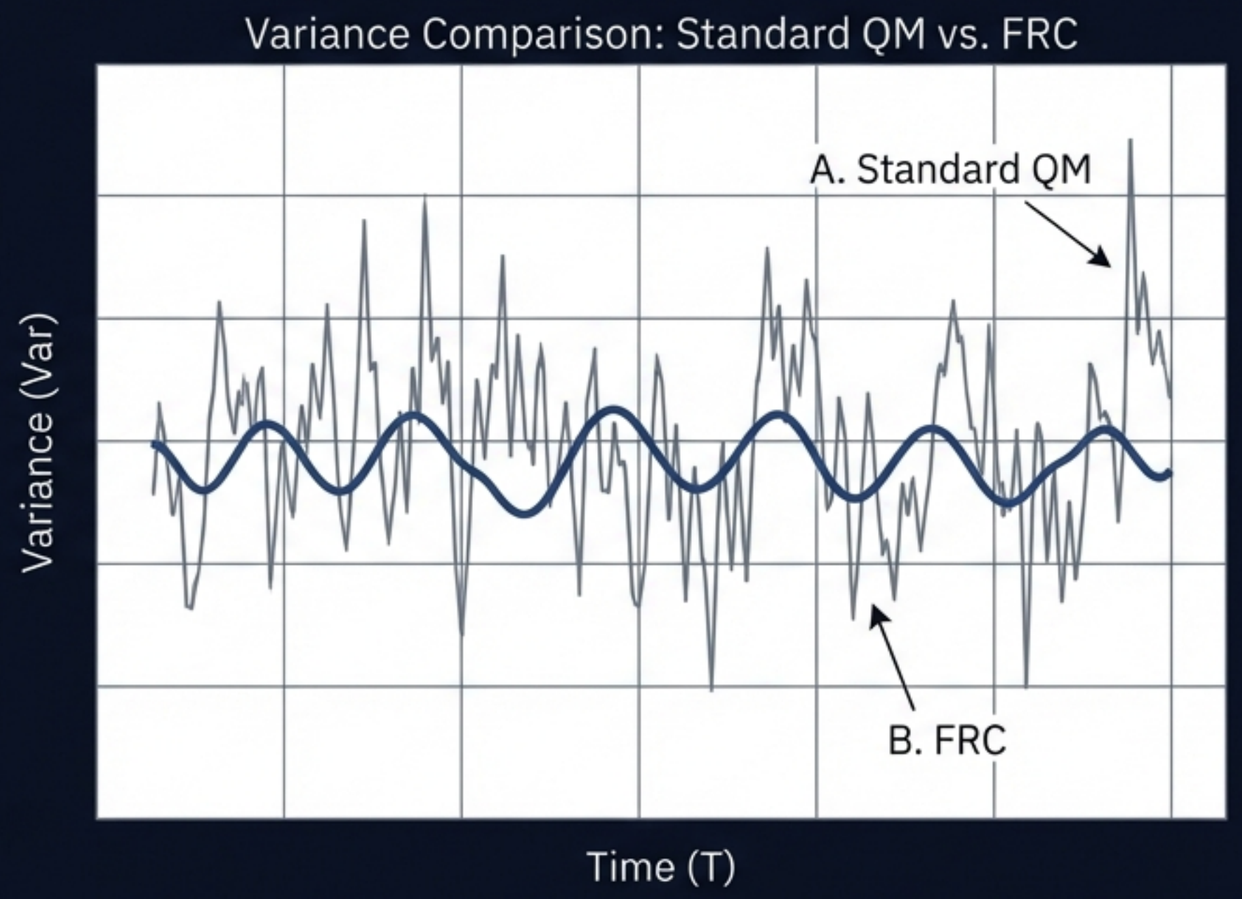


NotebookLM

Variance Suppression

$$Var \sim \gamma_m T - \alpha T^2$$

FRC predicts a negative quadratic term in the variance of weak measurement records. The drift systematically suppresses excursions from the attractor.



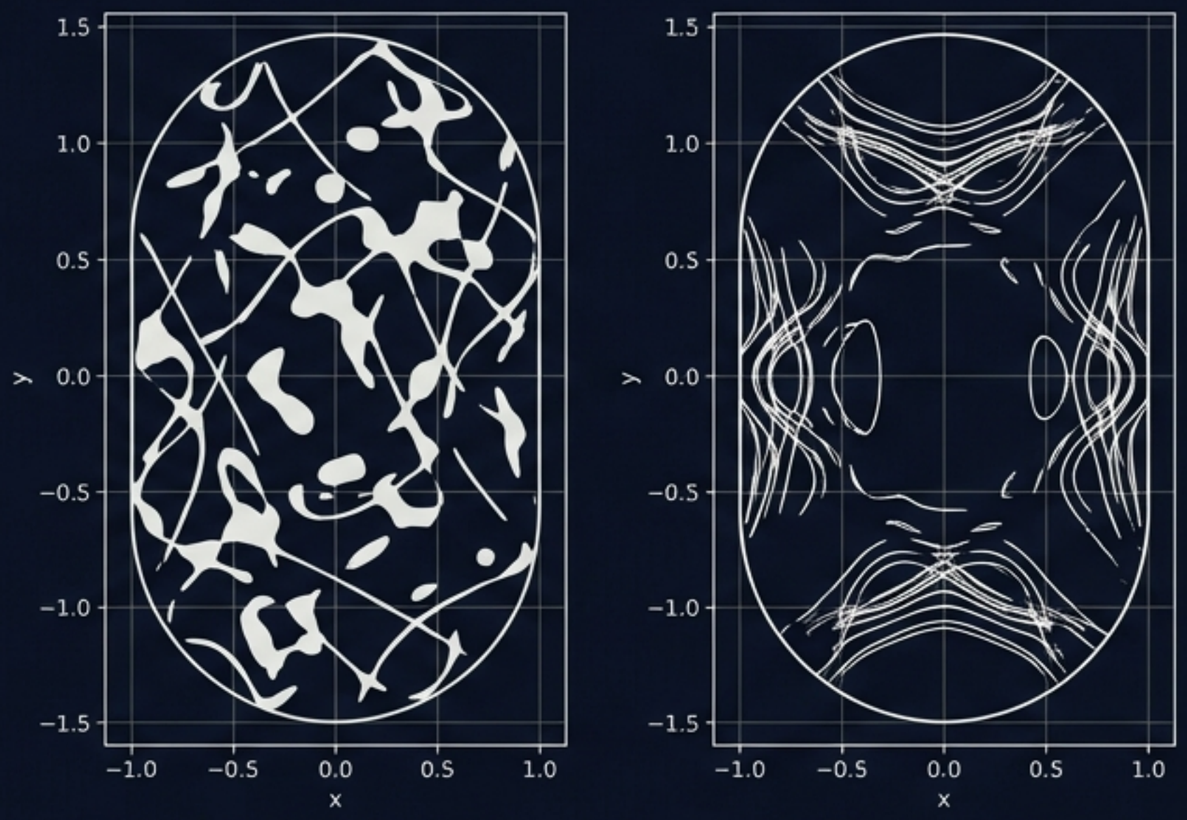
Velocity Autocorrelation: The system 'remembers' where it is going.

NotebookLM

The Fractal Signature

The geometry of the resonance is self-similar. In quantum chaotic systems like the Stadium Billiard, FRC induces nodal patterns with fractal dimension $D \approx 1.90$.

Standard chaos is $D \approx 1.2$. FRC is $D \approx 1.9$. Structure emerges from the void.



(a) Unperturbed (σ=0) (b) Perturbed (σ=0.1)

NotebookLM

The Case File: Summary of Evidence

Born Rule =
Equilibrium

Mechanism =
Coherence Drift

Signature =
Finite-time Deviation

We replace the axiom of randomness with a mechanism of **resonance**. The universe is **lawful**, even in the dark.

NotebookLM

The Hunt Begins

The theory is sound. The math is predictive.
The next step is the lab.

We are no longer looking for particles.
We are looking for the lag.
